INSTRUCTIONS

- 1. This exam consists of 9 pages, a page of thermodynamic data, a page of useful information and equations, and a periodic table. If a page is missing, take the exam to a proctor immediately.
- 2. PRINT your name NOW in the spaces at the top of ALL pages.
- 3. Part A is worth 30 points. Part B is worth 51 points. Part C is worth 19 points.
- 4. The exam should be easy to complete in 75 minutes. Check your work after completing the exam. Please show all your work and be certain that all your explanations are given as complete sentences.
- 5. On the grading chart at the bottom of this page, CIRCLE the numbers of the questions you would like to be graded. Check that you have circled the correct number of questions for Parts A (2), B (3) and C (1).

Code: ork and tr					the	exam	Ī	am	handing	in	is	solely	my

PART A. (30 points) **BASIC QUESTIONS**. Answer TWO of the following four questions. Write your answer in the space provided. <u>SHOW YOUR WORK AND WRITE EXPLANATIONS IN FULL SENTENCES</u>.

1. The following questions refer to the reaction below. In parts a) and b), circle the correct answer.

$$N_2(g) + O_2(g) ----> 2 \text{ NO } (g) \quad \Delta H^\circ = 181.8 \text{ kJ}$$

- a) This reaction is exothermic / endothermic.
- b) Heat is released / absorbed by the chemicals in this reaction.
- c) Write the reaction for which the enthalpy is the standard heat of formation of NO and calculate ΔH°_{f} .
- d) Calculate the amount of heat transferred when 300. g of N_2 are reacted with excess O_2 .

2. In the following reaction identify the oxidant and the reductant and give the oxidation numbers of the indicated atoms in the reactants and the products.

oxidant____

reductant____

Fe reactants____

products____

Ni reactants____

products____

N reactants____

products____

O reactants____

products____

	Name
3.	The emission spectrum of hydrogen consists of four lines in the visible wavelengths at 656.3 nm, 486.1 nm, 434.1 nm and 410.2 nm. Calculate the value in parts a-c) and circle the correct phrase in part d).
	a) The lowest energy line is atnm.
	b) The frequency of this line is s ⁻¹ .
	c) The energy of this line is J.
	d) Energy is absorbed in the form of light when electrons move from: higher energy states to lower energy states / lower energy states to higher energy states.
4.	How many grams of potassium nitrate are needed to make 500.00 mL of a 0.155 M aqueous solution?

Name		

Part B (51 points) **COMPETENCY QUESTIONS** Answer THREE of the following six questions in the space provided. <u>SHOW YOUR WORK AND WRITE EXPLANATIONS IN FULL SENTENCES</u>.

5. A 25.00 mL calcium hydroxide solution of unknown concentration was titrated with 0.2500 M hydrochloric acid. It required 37.52 mL of acid to reach the endpoint. What was the concentration of the calcium hydroxide solution?

6. What mass of precipitate is produced when 35.0 mL of 0.136 M AgNO₃ is combined with 18.0 mL 0.255 M KBr?

Name	
------	--

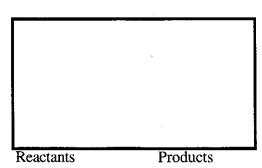

7. a) Using the thermochemical data provided at the end of this exam, calculate ΔH°_{rxn} for the combustion of 1 mol of propane. The balanced reaction for this process is given below.

$$C_3H_8(g) + 5 O_2(g) \rightarrow 3 CO_2(g) + 4 H_2O(g) \Delta H^{\circ}_{rxa} = kJ/mol$$

b) Use the information below to calculate ΔH°_{rxn} for the combustion of propane to produce liquid water instead of gaseous water.

$$H_2O(1) \rightarrow H_2O(g) \quad \Delta H_{rxn}^{\circ} = 44 \text{ kJ/mol}$$

8. Write a balanced chemical equation, including states, for the reaction of aqueous iron (III) nitrate with aqueous sodium hydroxide. In the box below make a two-dimensional drawing of the submicroscopic particles of the reactants and products in the reaction. Include six water molecules in your drawing.

Name	

- a) Three sets of possible quantum numbers for an electron in a hydrogen atom are given below. Identify the two impossible sets and explain why each is unreasonable. 9.
 - 1) n = 2, l = 3, $m_i = -3$ 2) n = 3, l = 1, $m_l = 2$ 3) n = 2, l = 1, $m_l = 0$

b) Draw a picture of an orbital designated by the quantum numbers n = 3, l = 1, $m_l = -1$.

c) Explain, in words and a picture, how the orbital you drew in part b would differ if n = 2and the other quantum numbers remained the same.

Name	

10.	Cobalt (II) carbonate	reacts with aqu	ueous hydrob	promic acid.
-----	----------	---------------	-----------------	--------------	--------------

a) Write the balanced overall reaction for this process.

b) Write the total (complete) ionic equation for this process. Identify the spectator ions if any are present.

c) Write the net ionic equation for this process.

d) What type of reaction is this? Explain how you arrived at your conclusion identifying those species characteristic of the reaction type (i.e. identify the acid and base in an acid/base reaction, the precipitate for a precipitation reaction, the gas formed in a gas forming reaction, and the oxidant and reductant in an oxidation/reduction reaction.) Note that a reaction may be of more than one type.

Name	
141110	

Part C (19 points) **MASTERY QUESTIONS** Answer ONE of the following two questions in the space provided. <u>SHOW ALL YOUR WORK AND WRITE EXPLANATIONS IN COMPLETE SENTENCES.</u>

11. The following questions refer to the balanced thermochemical equation given below.

$$CuSO_4 (aq) + 2 KOH (aq) \rightarrow Cu(OH)_2 (s) + K_2SO_4 (aq) \Delta H = -52.1 kJ$$

a) In a coffee cup calorimeter, $55.0 \, \text{mL}$ of $1.26 \, \text{M}$ CuSO₄ was reacted with $43.5 \, \text{mL}$ 2.53 M KOH. The chemicals were initially at $23.2 \, ^{\circ}\text{C}$. What was the final temperature measured when the reaction was complete? (Assume that the solutions have the properties of pure water, i.e a density of $1.0 \, \text{g/mL}$ and a specific heat capacity of $4.2 \, \text{J/g} \, ^{\circ}\text{C}$.)

b) How many moles of $CuSO_4$ must react with excess KOH to melt an 18.0 g ice cube at $0^{\circ}C$? The heat of fusion of water is 6.00 kJ/mol.

12. You walk into the laboratory and your TA hands you four clear colorless solutions in unmarked test tubes. She tells you that she is certain that one solution is NaHCO₃, the second is NaOH, the third is ZnCl₂, and the fourth is NaBr. Describe how you would determine which solution is which. Assume that you have available all the laboratory equipment that you have used in the laboratory and access to whatever chemicals you need. You may use process of elimination, but you must describe one experiment to positively identify each solution. Write a balanced chemical equation for each reaction you run.

$$d = \frac{m}{V} \qquad PV = nRT \qquad STP \ 0^{\circ}C, \ 1 \ atm$$

$$P_{tot} = P_1 + P_2 + P_3... \qquad \chi_1 = \frac{n_1}{n_{tot}} = \frac{P_1}{P_{tot}}$$

$$u_{rms} = \sqrt{\frac{3RT}{MW}} \qquad \left(P - \frac{n^2 a}{V^2}\right) \left(V - nb\right) = nRT$$

$$\Delta H^{\circ}_{rxn} = \sum [\Delta H^{\circ}_{f} (products)] - \sum [\Delta H^{\circ}_{f} (reactants)] \qquad P_1 = x_1 P^{\circ}_1$$

$$c = \lambda v \qquad E = \frac{hc}{\lambda} = hv \qquad q = mC\Delta T$$

$$P = \frac{2}{3} \left[\frac{nN_{A}(1/2mu^2)}{V}\right] \qquad \Delta T_{f,b} = K_{f,b} m_{solute} i \text{ (where } i = moles of particles)}$$

B.O. = $\frac{1}{2}$ (bonding e's – antibonding e's)

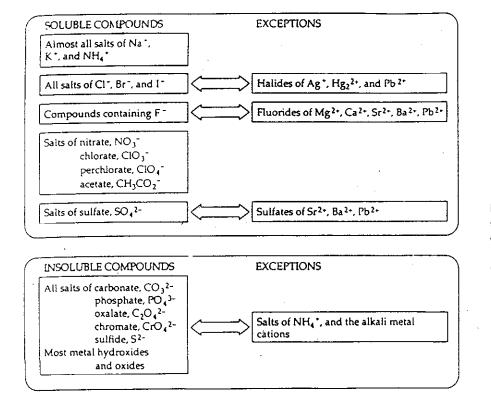

Figure 4.7 Guidelines to predict the solubility of ionic compounds. If a compound contains one of the ions in the column on the left in the top chart, the compound is predicted to be at least moderately soluble in water. There are a few exceptions, and those are noted at the right. Poorly soluble ionic compounds are usually formed by the anions listed a the bottom of the chart, with the exceptions of compounds with NH₄* and the alkali metal cations.
